(1) 1999 median income numbers are derived from the 2000 U.S. Census of Population and Housing.

(2) Estimates of median household money income for the inter- and post-Census years are based on the Bureau of Economic Analysis (BEA) per capita income data and the estimates of household characteristics, at the county level.

(3) Preliminary estimates for 2008 are based on the payroll data compiled by the state Employment Security Department and the state personal income data published by BEA.

(4) Projection for the year 2009 is based on the Revenue Forecast Council's September 2009 forecast of the state personal income

Money income, as defined by the Bureau of the Census, includes wage or salary income; self-employment income; interest, dividend, or rental income; social security or public assistance income; retirement or disability income; etc. It excludes some of the income components of personal income defined by the BEA. For example, employer-paid pension and medical benefits are included in personal income but not in money income. The median measures the point at which half of all households have more income and half have less.
